Education

B.S. Stevens Institute of Technology, Hoboken, NJ *Quantitative Finance | GPA: 3.7 / 4.0* Anticipated May 2028

- *Awards:* Edwin Augustus Stevens Scholarship ($104k), Presidential Scholarship ($20k)
- *Coursework:* Financial Time Series, Algorithms (C++), Advanced Probability & Stochastic Processes for QF, Financial Econometrics, Advanced Time Series & Machine Learning, Market Microstructure Trading Strategies, Linear Algebra

Experience

Stevens Student Managed Investment Fund *Multi-Factor Model Fixed Income Analyst (Incoming)* Jan 2027 – Dec 2027

- Will help build the fund's first fixed income factor model

10-Q Equity Research Agent Repo | Live App Summer 2025 – Oct 2026

- Built a 6-step LLM pipeline (Python, Gemma 4 via Gemini API) that turns each company's 10-Q text and XBRL financials, pulled live from SEC EDGAR, into a Bullish/Neutral/Bearish call; deployed as a public Streamlit app
- Backtested 2,990 S&P 500 10-Qs (Jul 2024 – Jun 2026) on point-in-time inputs against Wall Street consensus, momentum, and always-bullish baselines; over 90 days, Bullish calls beat the S&P 500 by 1.6% vs. −0.3% for Bearish
- Tested the result for lookahead bias: on 2026 filings, the period least likely to be in the model's training data, the spread fell from 2.1 to 0.8 points and Wall Street edged the agent, so I report the edge as unproven

Projects

Polymarket US Quantitative Trading System Paper Jun 2026 – Jul 2026

- Built two strategies trading Polymarket US World Cup player-prop contracts, earning $815 profit on $1,200 (+67.9%) in 35 days
- Engineered an unattended, Ed25519-authenticated Python pipeline that logged 157,595 three-leg quotes to SQLite and recomputed each player's fair value up to every 60 seconds before kickoff; traded its signals by hand, bidding below fair value
- Validated the core mispricing with a Monte Carlo null-hypothesis test: 71.4% of positions reverted toward fair value vs. 18.8% under a volatility-matched random walk ($p = 0.00003$); the patience strategy earned $274 over 40 positions
- Ran an event-driven speed strategy that bought contracts at $0.92–$0.99 and won all 136 held positions (+$541)

Kaiser-Stats Repo | Live App Jul 2026 – Present

- Built a stats engine unifying 5 seasons (2022–2026, ~280+ games) of a local soccer league's inconsistent spreadsheet history into one per-player dataset
- Automated weekly updates: a scheduled routine uses the Gemini API to parse the league's game-report emails and add the weekend's games, then a separate stress tester independently validates the results
- Shipped a public registration and stats website now used by a 110+ person league mailing list, backed by data-integrity safeguards (player identity resolution, plus-minus sanity checks) and a transparent power-ranking formula (Next.js, Supabase)

FIBA Annual Stock Pitch Competition Presentation Sep 2025 – Oct 2025

- Placed 3rd of 15+ teams pitching a DCF valuation model to evaluate Disney (NYSE: DIS), covering competitive advantage, headwinds, and tailwinds to judges

Awards

Vanguard ETF Challenge Article Sep 2025 – Dec 2025

- Ranked #1 of 50 teams in total return (+2.58%) and 2nd overall by Sharpe ratio (1.49), the only team to beat the S&P 500
- Analyzed win rates across the team's simulated portfolios to guard against early losses; pitched RHO, our low-correlation ETF, to Vanguard at the New York Stock Exchange, placing 2nd of 6 finalist teams

Skills

- *Programming:* Python (Pandas, NumPy, scikit-learn), SQL, R
- *Tools:* Microsoft Excel, PowerPoint, Word, Git, SQLite, Streamlit, Supabase, Vercel, Gemini API
- *Involvements:* Finance Investment Banking & Advisory Society (FIBA), Scholars of Finance (SoF), Poker Club
- *Data/ML:* statistical modeling, regression analysis, time-series forecasting, Monte Carlo methods, portfolio optimization
